

# JavaScript Introduction

Topic discussed

---

- jQuery

# jQuery

## Introduction

---

jQuery JavaScript library:

- In widespread but possibly declining use.
- Competitors exist:
  - Prototype
  - Modernizer
  - Frameworks (Angular, Ember, . . . )
- jQuery hides browser incompatibilities
- Facilitates finding & manipulating elements in document

# jQuery

## Features

---

Facilitates modifications to web page:

- Add or change specific content
- Change HTML attributes
- Change CSS properties
- Define event handlers
- Perform animation

```
<body>
  <button class="edit" onclick="change()">Change</button>
  <script src="jquery.js"></script>
  <script>
    function change(){
      $("button.edit").html("Next Step... ");
    }
  </script>
</body>
```

# jQuery

## Focus

---

jQuery focussed on queries

Typically uses CSS selectors

- Identify set document elements
- Return object representing these
- Object has useful methods to operate on data
- Method chaining provided where possible
- Can operate on elements as group rather than individually

```
// Returns a jQuery object containing all div elements in document.  
// Observe jQuery variable naming convention: $div.  
let $divs = $('div');  
console.log($divs);
```

# jQuery

## Returned jQuery object

```
<body>
  <button onclick="lotsadivs()">Press</button>
  <div id= 'div-1'>
    <div id= 'div-2'>
      </div>
    </div>
  <script src="jquery-2.2.3.min.js"></script>
  <script src="jquery.js"></script>
</body>
```

```
//File: jquery.js
function lotsadivs(){
  console.log($('div').length);
}
```

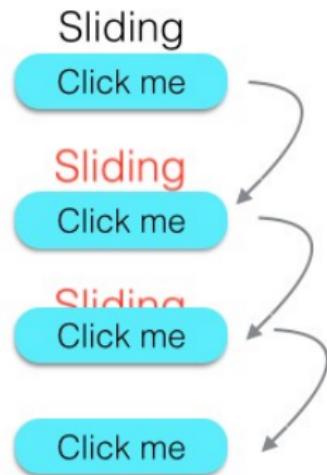

```
// output
[div#div-1, div#div-2, ... selector:"div"]
```

# jQuery

## Method chaining

```
//html
<body>
  <p id="p1">sliding</p>
  <button>Click me</button>

  <script src="jquery.js"></script>
  <script>
    $(function()
    {
      $('button').click(function(){
        $('#p1').css('color','red').slideUp(2000);
      });
    });
  </script>
</body>
```

# jQuery

## Terminology

### the jQuery function

- `$()` or `jQuery()`: single global function

### a jQuery object

- is object returned by `$()`

### the selected elements

- determined by CSS selector parameter in `$`

### a jQuery function

- a function defined within `$()`

### a jQuery method

- bound to jQuery object

```
//these 2 methods exactly the same
function change(){
    $("button.edit").html('Next');
}

function change(){
    jQuery("button.edit").html('Next');
}
//jQuery function: invoke func for each
//element of array
$.each(array, func);

//jQuery method: invoke func2 once for
//each selected element
$('a').each(func2);
```

# jQuery

## \$array.each()

---

### ↳ **.each( function )**

version added: 1.0

#### **function**

Type: [Function\( Integer index, Element element \)](#)

A function to execute for each matched element.

```
// .each is a utility function
'use strict';
$.each([1, 2, 3, 4], function (index, element) {
  console.log('index: ', index, ' element: ', element);
```

```
index: 0  element: 1
index: 1  element: 2
index: 2  element: 3
index: 3  element: 4
```

Output

# jQuery

## `$(array).each()`

<code>.each(function)</code>	<i>Returns: jQuery</i>
------------------------------	------------------------

**Description:** Iterate over a jQuery object, executing a function for each matched element.

### `.each(function)`

version added: 1.0

**function**  
Type: `Function` `Integer index, Element element`  
A function to execute for each matched element.

```
'use strict';
let $array = $([1, 2, 3, 4]);
$array.each(function (x, y, z) {
  console.log('x = ', x, ' y = ', y, ' z = ');
});
```

x = 0	y = 1	Ignored z =
x = 1	y = 2	z =
x = 2	y = 3	z =
x = 3	y = 4	z =

Output

# jQuery

## \$.each() methods comparison

---

```
// .each generic iterator function - utility function
$.each([1, 2, 3, 4], function (index, element) {
    console.log('index = ', index, ' element = ', element);
});
```

```
// Iterate over a jQuery object $([1, 2, 3, 4])
$([1, 2, 3, 4]).each(function (index, element) {
    console.log('index = ', index, ' element = ', element);
});
```

```
index: 0  element: 1
index: 1  element: 2  Output: same for both function calls.
index: 2  element: 3
index: 3  element: 4
```

# jQuery

## How to Obtain

---

### Method 1

- Download from *jquery.com*

### Method 2

- Use a content distribution network (CDN)
  - code.jquery.com/jquery-3.0.0.min.js
  - ajax.microsoft.com/ajax/jquery/jquery-3.0.0.min.js
  - ajax.googleapis.com/ajax/libs/jquery/3.0.0/jquery.min.js

```
//include jquery script tag before other script calls at end document  body  
//ensure use latest versions jquery (not shown here)  
<script src="//ajax.googleapis.com/ajax/libs/jquery/1.11.1/jquery.min.js">
```

# JavaScript

## JQuery source - development usage

---

```
// extract from jquery-2.2.4.js
jQuery = function(selector, context) {
    // The jQuery object is actually just the init constructor 'enhanced'
    return new jQuery.fn.init( selector, context, rootjQuery );
},
// Match a standalone tag
rsingleTag = /^<(\w+)\s*/?>(?:<\/\1>|)$/,

// Matches dashed string for camelizing
rmsPrefix = /^-ms-/,
rdashAlpha = /-([\da-z])/gi,

// Used by jQuery.camelCase as callback to replace()
fcamelCase = function(all, letter) {
    return letter.toUpperCase();
},
```

# JavaScript

## Minified jQuery

---

```
// extract from jquery-1.6.4.min.js
/*! jQuery v1.6.4 http://jquery.com/ | http://jquery.org/license */
(function(a,b){function cu(a){return f.isWindow(a)?a:a.nodeType==9?a.defaultView||a.parentWindow:!1}function cr(a){if(!cg[a]){var b=c.body,d=f("<"+a+">").appendTo(b),e=d.css("display");d.remove();if(e==="none"||e==""){ch||(ch=c.createElement("iframe")),ch.frameBorder=ch.width=ch.height=0},b.appendChild(ch);if(!ci||ch.createElement)ci=(ch.contentWindow||ch.contentDocument).document,ci.write((c.compatMode=="CSS1Compat"?"<!doctype html>":"")+"<html><body>"),ci.close();d=ci.createElement(a),ci.body.appendChild(d),e=f.css(d,"display"),b.removeChild(ch)}}cg[a]=e}return cg[a]}function cq(a,b){var c={};f.each(cm.concat.apply([],cm.slice(0,b)),function(){c[this]=a});return c}function cp(){cn=b}function co(){setTimeout(cp,0);return cn=f.now()}function cf(){try{return new a.ActiveXObject("Microsoft.XMLHTTP")}}catch(b){}function ce(){try{return new a.XMLHttpRequest}}catch(b){}}
```

# JavaScript

## Plaintext

---

```
// sample javascript code
function OBJNAME(n){ return n;}
function dw(str){ document.write(str);}
function dumtbl(obj, row_callback_str,cell_callback_str)
{
    dw('<table border=1>');
    for (var i = 0; i < obj.length; ++i)
    {
        var tr = '<tr>';
        eval(row_callback_str);
        dw(tr);
        for (var j = 0; j < obj[i].length; ++j )
        {
            var td_s = '<td>', td_e = '</td>';
            eval(cell_callback_str);
            dw(td_s); dw(obj[i][j]); dw(td_e);
        }
    }
    dw('</table>');
}
```

# JavaScript

## Obfuscated

---

```
// sample javascript code minified and obfuscated
function z8c231aa888(z14851c4b0f){return z14851c4b0f;}function
z0ab1f0a49e(z0721975593){document.write(z0721975593);}function
zcd8c17c79d(z4716861143,z500f443098,z9bc82e0042){z0ab1f0a49e("|

```

# JavaScript

## Scope - Window object

---

### Window object

- The global object
- Represents open window in browser
- Entry point client-side JavaScript
- Defines properties such as:
  - *location*: navigates to new page
  - *document*: returns DOM object

```
<!DOCTYPE html>
<html>
  <head>
    <title>Window</title>
  </head>
  <body>
    <script>
      window.location
        = "http://www.wit.ie";
    </script>
  </body>
</html>
```

# jQuery

## Invoking `$()` function

---

**jQuery()**, a.k.a **\$(())**,  
invokable with 4 different  
parameters:

- CSS selector
- Element, Document or Window object
- String of HTML
- Function

```
//CSS selector: <p id="p1"></p>
$('#p1').append('Added material...');

//Element: <p class='p2'></p>
$('.p2').append('Second para');

//String HTML: dynamically add node
('<p>Third para</p>').appendTo('body');

//Function: function clickbutton param
$(function clickbutton(){
    alert('Button clicked');
});
```

# jQuery

## Invoking \$() function

### example.html

```
1 <!DOCTYPE html>
2 <html>
3 <head>
4     <title>ICTSkills JavaScript</title>
5 </head>
6 <body>
7     <p id="p1"></p>
8     <script src="js/jquery-2.0.0.js"></script>
9     <script src="js/selectors.js"></script>
10 </body>
11 </html>
```

### selectors.js

```
1 $("#p1").append("Added material...");
```

### example.html : output in browser

Added material...

# jQuery

## Immediately-Invoked Function Expression (IIFE)

```
// Click button to trigger alert
<button onclick="clickbutton()">Click</button>
<script src="jquery.js"></script>
<script>
    function clickbutton(){
        alert('Button clicked');
    }
</script>
```

```
// Example of self-invoking function
// Alert triggered on refreshing page
<script src="jquery.js"></script>
<script>
    (function clickbutton(){
        alert('Button clicked');
    })();
</script>
```

# jQuery

Execute function when document loaded

---

## onload event

- Ensure page load complete before accessing script code.

```
$(function() {  
    alert('Page has loaded');  
});
```

```
// Older, verbose equivalent  
$(document).ready(function () {  
    alert('Page has loaded');  
});
```

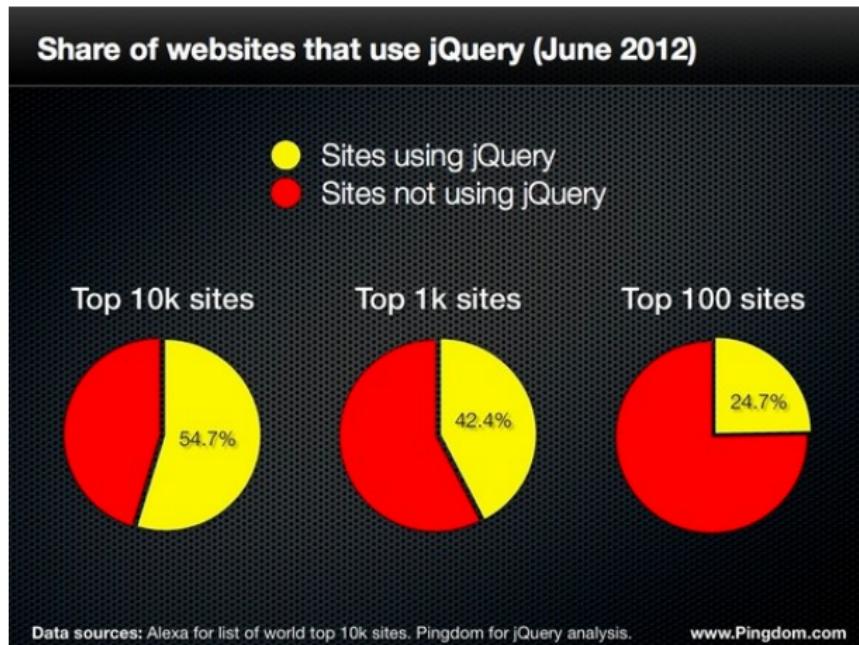

# Summary

---

- jQuery
  - A popular JavaScript library.
  - May be declining in popularity.
  - Losing market share to frameworks.
  - Abstracts browser inconsistencies.
  - Community support.
  - jquery-3.0.0 (June 2016) contains more than 10,000 lines.

## You Don't Need jQuery!

Free yourself from the chains of jQuery by embracing and understanding the modern Web API and discovering various directed libraries to help you fill in the gaps.

[Blog](#) [About](#)

---

## You Don't Need jQuery (anymore)

A lot of web developers rely on jQuery. In many circles, jQuery and JavaScript are one in the same it seems. So, why shouldn't you use it? Why should you stop using it? Don't you just *need* it?

jQuery makes...
