

# Aurelia First Steps

---

# Aurelia

*“Aurelia is a JavaScript client framework for mobile, desktop and web leveraging simple conventions and empowering creativity”*

## Technical Principles:

- Forward-thinking
- Two-Way Databinding
- Routing & UI Composition
- Broad Language Support
- Modern Architecture
- Extensible HTML
- MV\* with Conventions
- Testable

# The Aurelia CLI

---

## The Aurelia CLI [Edit](#)

by Rob Eisenberg

Learn how to get setup with the Aurelia CLI and use its basic capabilities.

---

Keywords: Getting Started, ES2015, ES2016, TypeScript

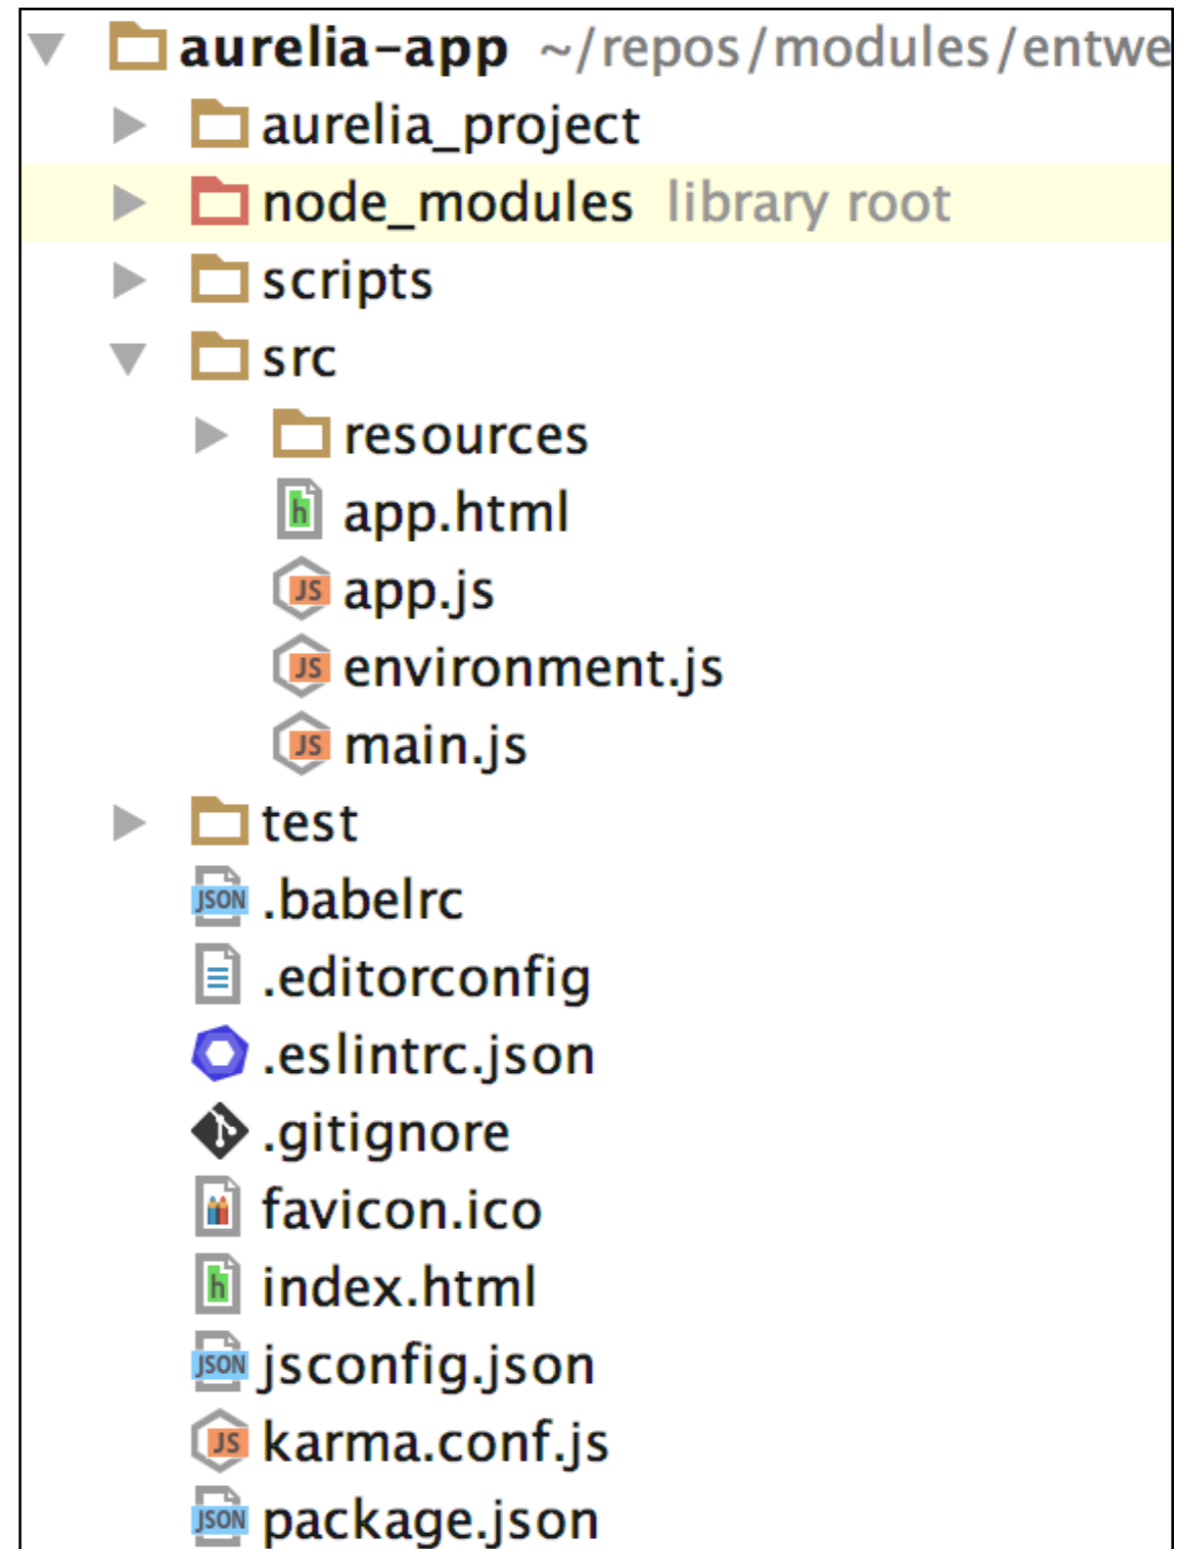

- A simple command line program to create and run aurelia apps

```
npm install aurelia-cli -g
```

# New Command

```
au new donation-client
```

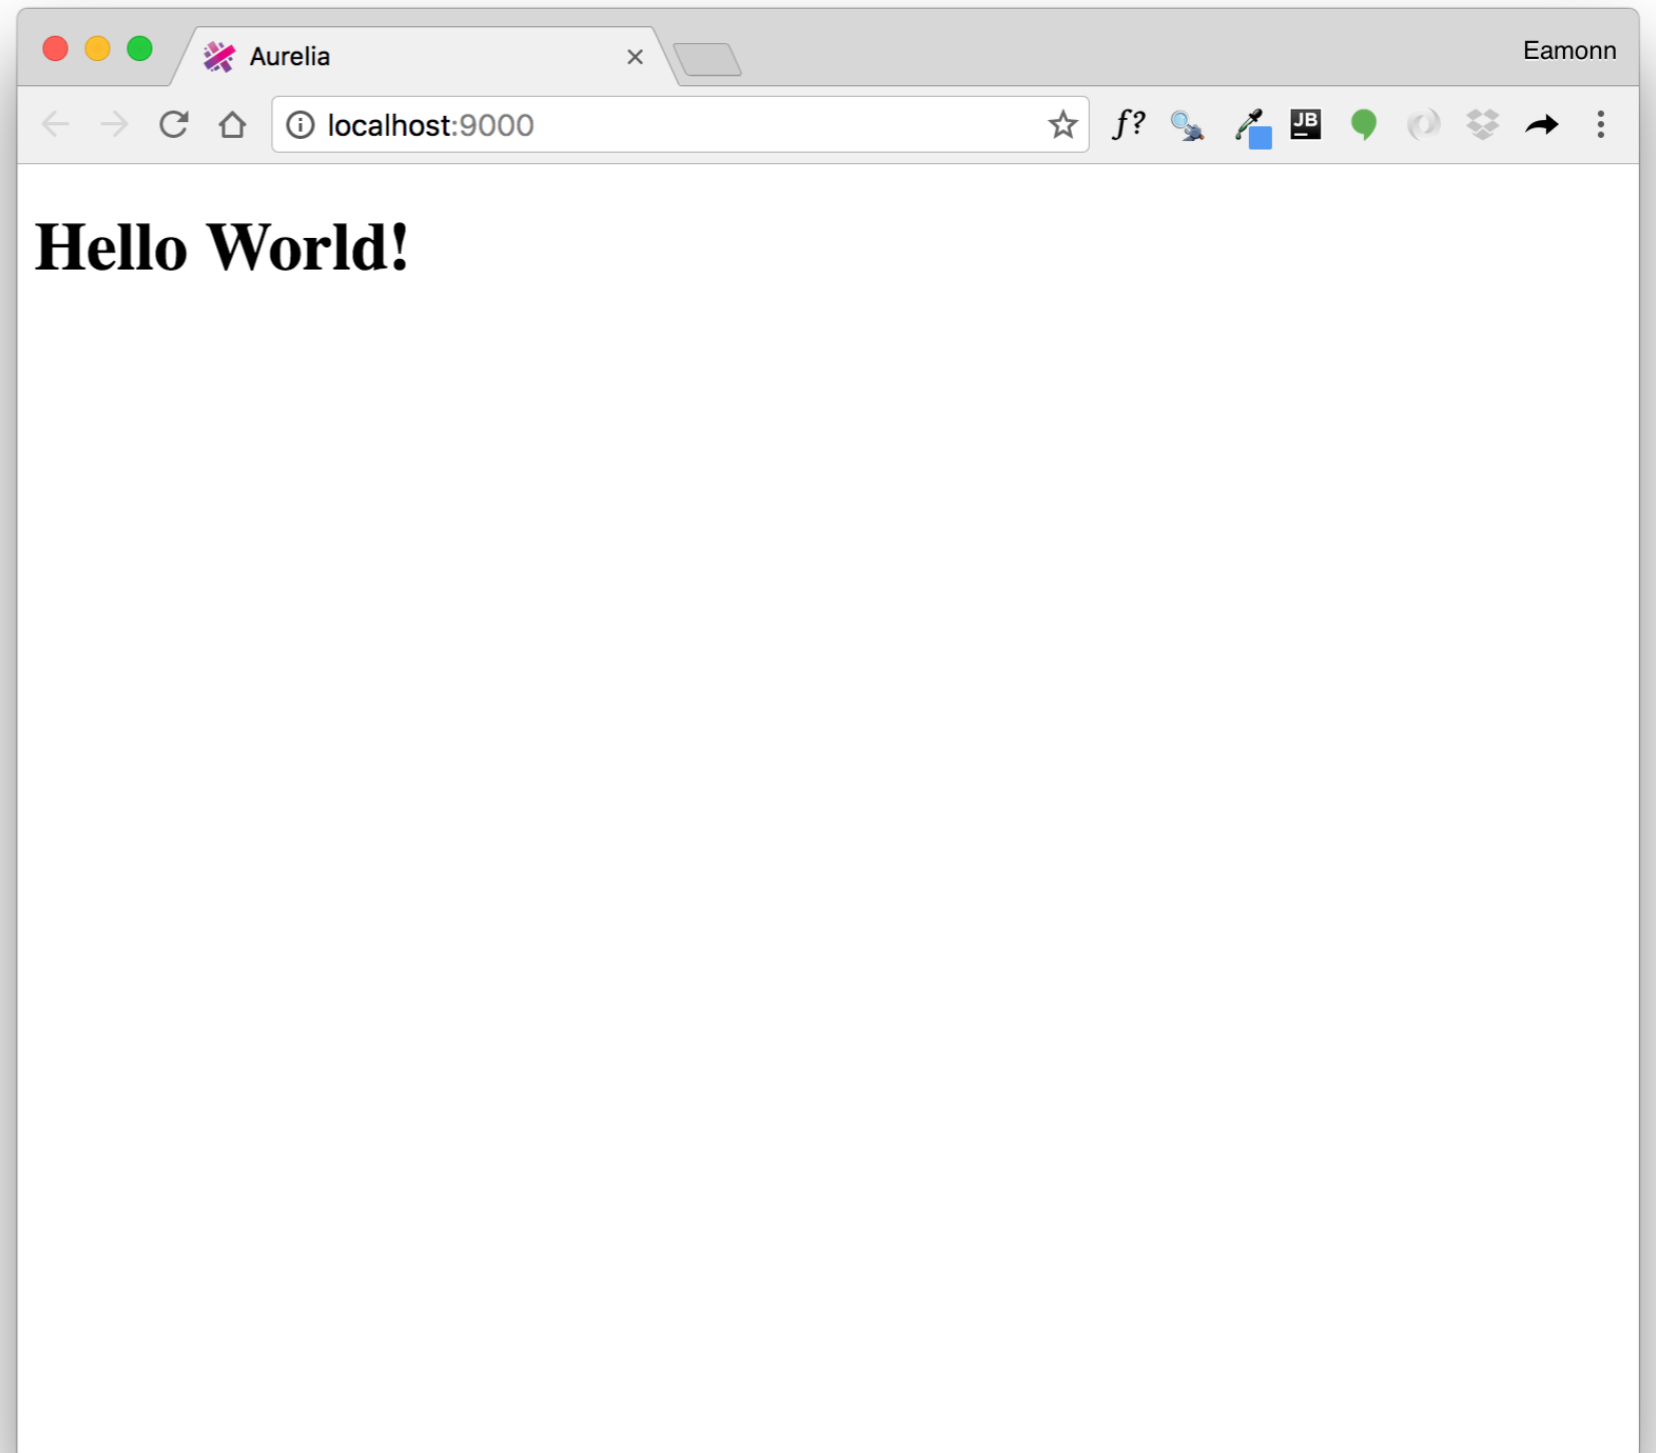

- Creates a complete starter application.
- Extensive scaffolding and support infrastructure
- Developer only needs to focus on:
  - **src** folder - containing the application sources
  - index.html - the start page for the app
- Remaining files + folders are build files, scaffolding or generated by aurelia

# Run Command

```
au run --watch
```

- Launches the app.
- Browsable on <http://localhost:9000/>
- Any changes to source will refresh app

# Debug

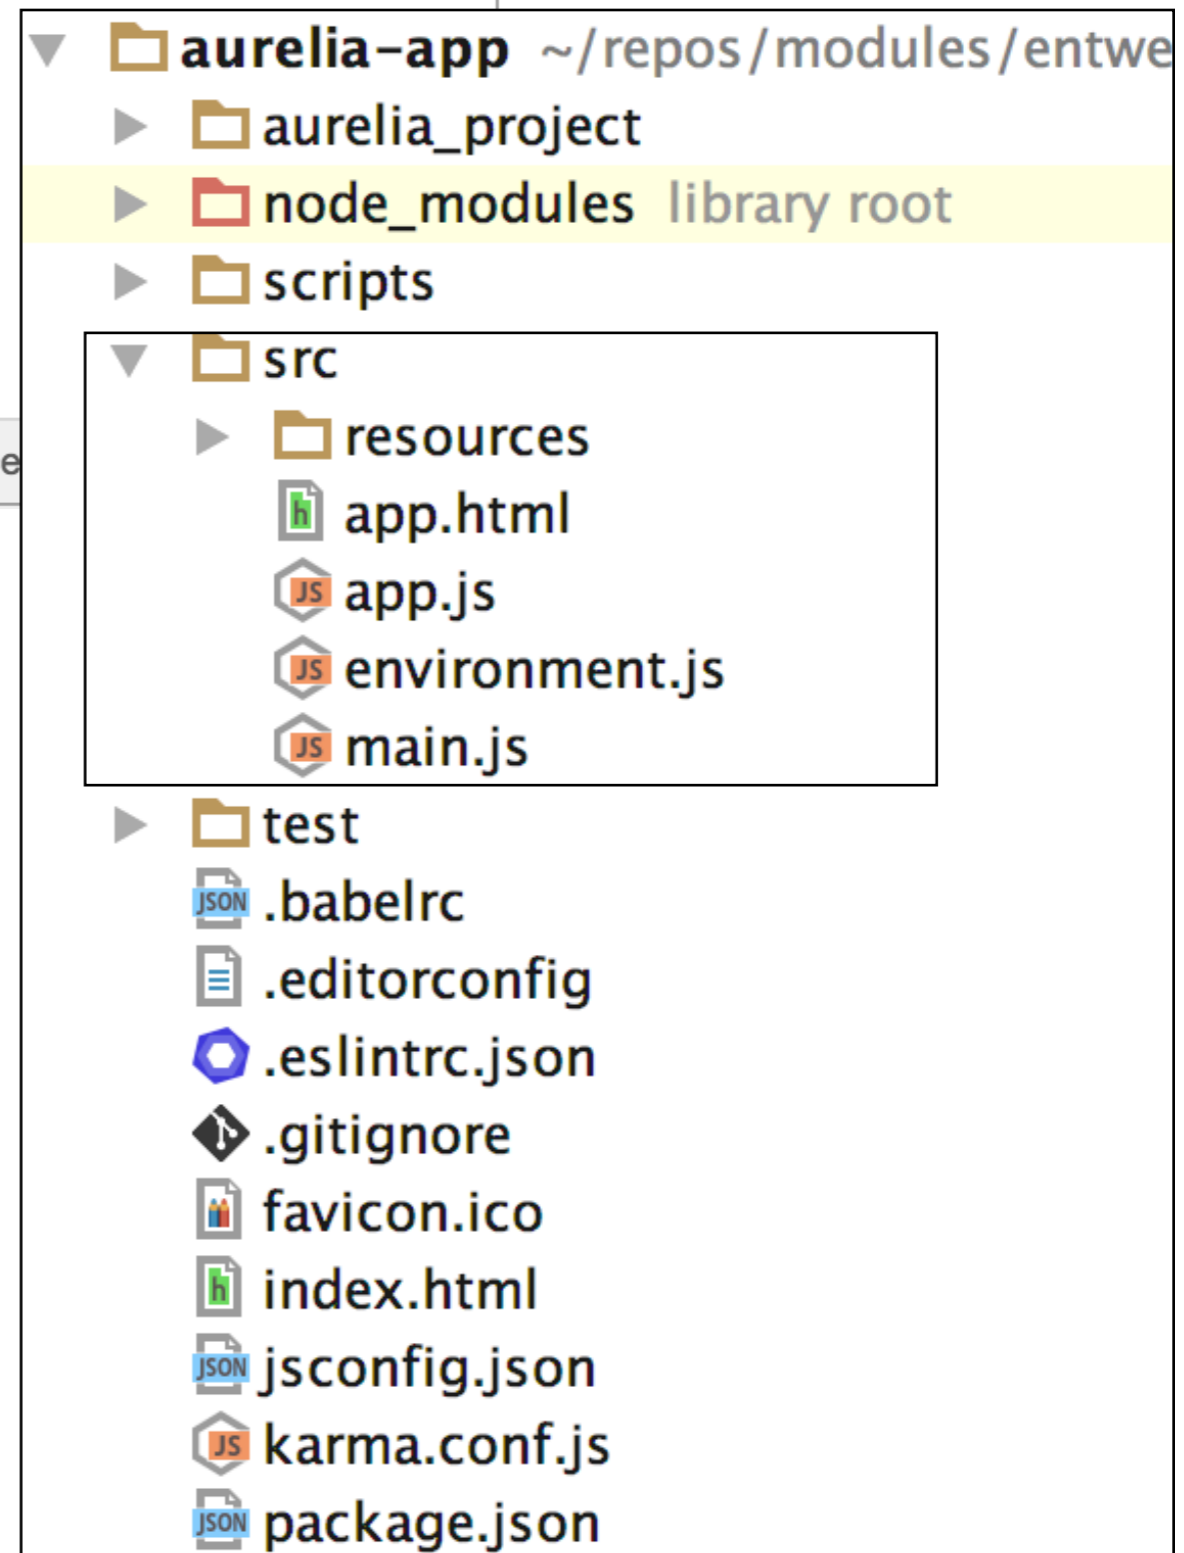

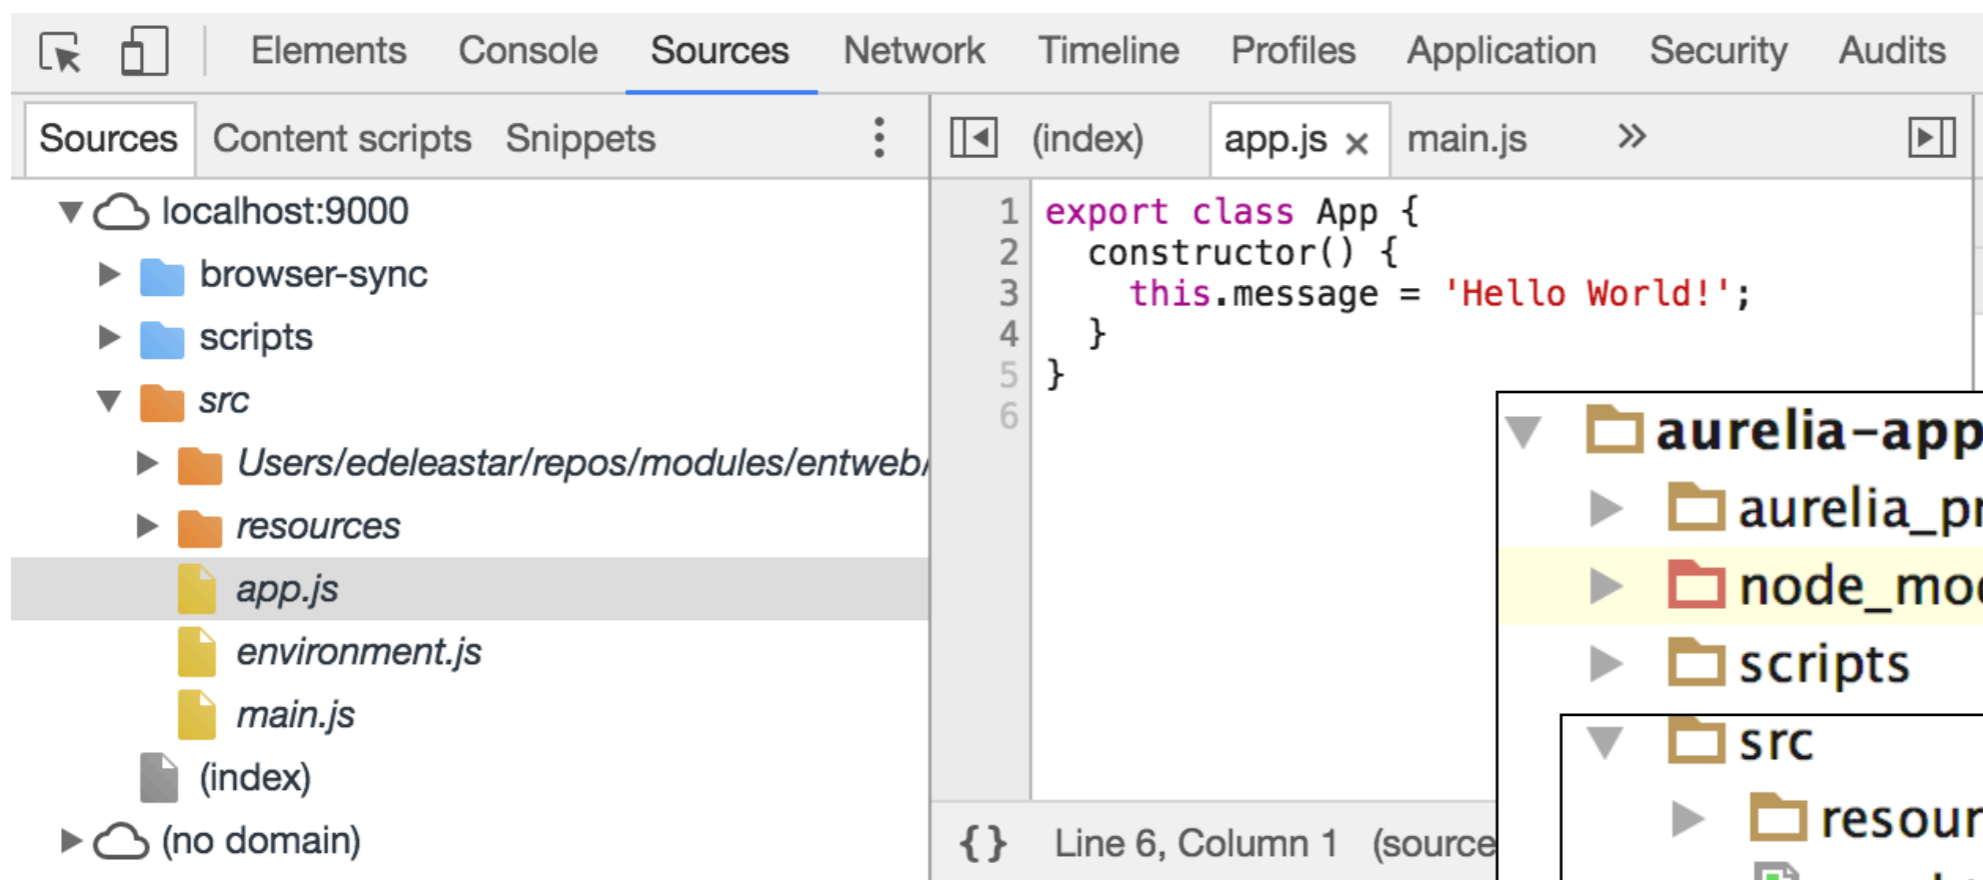

- App can be debugged in browser:
- breakpoints
- single step
- variable inspection
- console messages

The screenshot shows a web browser window with the URL `localhost:9000` and the text **Hello World!** displayed on the page. The browser's developer tools are open, showing the **Sources** panel on the left, the **Console** panel at the bottom, and the **Elements**, **Network**, **Timeline**, **Profiles**, **Application**, **Security**, and **Audits** panels at the top. The **Sources** panel shows the file `app.js` selected, with the following code visible:

```
1 export class App {
2   constructor() {
3     this.message = 'Hello World!';
4   }
5 }
6 |
```

The **Console** panel shows the following messages:

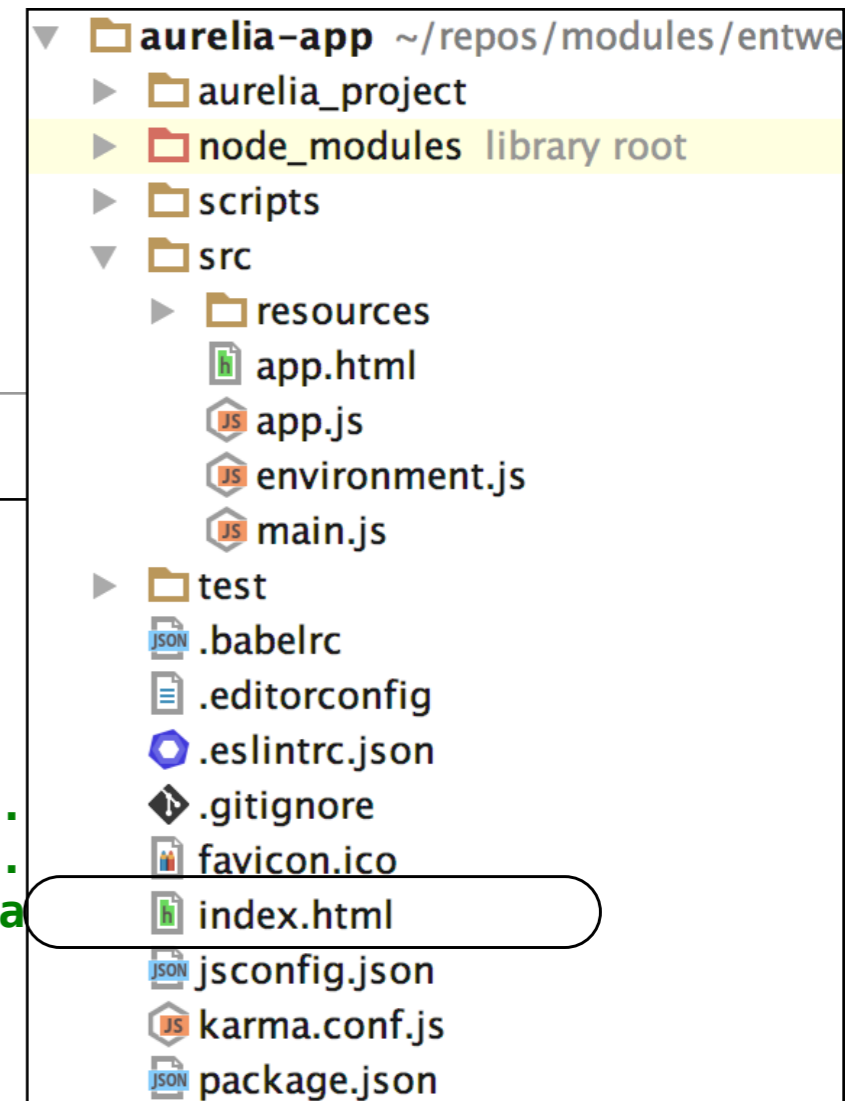

- DEBUG [aurelia] Configured plugin resources/index. vendor-bundle.js:11707
- DEBUG [aurelia] Loading plugin aurelia-testing. vendor-bundle.js:11707
- DEBUG [aurelia] Configured plugin aurelia-testing. vendor-bundle.js:11707
- DEBUG [templating] importing resources for aurelia-templating-resources/compose ▶ Array[0] vendor-bundle.js:11707
- DEBUG [templating] importing resources for aurelia-templating-router/router-view ▶ Array[0] vendor-bundle.js:11707
- INFO [aurelia] Aurelia Started vendor-bundle.js:11717
- DEBUG [templating] importing resources for app.html ▶ Array[0] vendor-bundle.js:11707

- src is a mapping of the project folder
- all Javascript files will be mapped here

# index.html

```
<!DOCTYPE html>
<html>
  <head>
    <title>Donation</title>
    <meta charset="UTF-8">
    <script type="text/javascript" src="https://cdnjs.cloudflare.com/ajax/libs/...>
    <script type="text/javascript" src="https://cdnjs.cloudflare.com/ajax/libs/...>
    <link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/...>
  </head>
  <body aurelia-app="main">
    <script src="scripts/vendor-bundle.js" data-main="aurelia-bootstrapper"></script>
  </body>
</html>
```

- The main entry point for application.
- Include main stylesheet here - but not further modification necessary
- Entire application is generated by aurelia build process into **scripts** folder and automatically loaded

# A view

---

## Enter Amount

Amount

Donate

```
<template>
  <form submit.trigger="makeDonation()" class="ui form four ..." >
    <div class="grouped inline fields">
      <h3>Enter Amount </h3>
      <div class="field">
        <label>Amount</label> <input type="number" value.bind="amount">
      </div>
    </div>
    <button class="ui blue submit button">Donate</button>
  </form>
</template>
```

- Encapsulated in an html `<template>`
- A standard form in this instance

# Binding - Html side

Enter Amount

Amount

0|

Donate

```
<template>
  <form submit.trigger="makeDonation()" class="ui form four
    <div class="grouped inline fields">
      <h3>Enter Amount </h3>
      <div class="field">
        <label>Amount</label> <input type="number" value.bind="amount">
      </div>
    </div>
    <button class="ui blue submit button">Donate</button>
  </form>
</template>
```

- *makeDonation()* and *amount* are **bound** to a javascript object
- Which object is not specified in the template - it is determined by context

# A view-model

---

- A standard javascript class
- Usually same name as view
- Is the default bind target for views

```
export class Donate {  
  amount = 0;  
  
  makeDonation() {  
    console.log(`Amount = ${this.amount}`);  
  }  
}
```

```

<template>
  <form submit.trigger="makeDonation()" class="ui form four ..." >
    <div class="grouped inline fields">
      <h3>Enter Amount </h3>
      <div class="field">
        <label>Amount</label> <input type="number" value.bind="amount" >
      </div>
    </div>
    <button class="ui blue submit button">Donate</button>
  </form>
</template>

```

```

export class Donate {

  amount = 0;

  makeDonation() {
    console.log(`Amount = ${this.amount}`);
  }
}

```

- No further code needed to establish event flow
- Values entered in bound fields automatically updated in class and vice-versa
- Pressing 'Donate' button triggers invocation of makeDonation() function

# app.js & app.html

- Another view / view-model pair
- Simply loads the **donate** view / view-model via the **compose** element

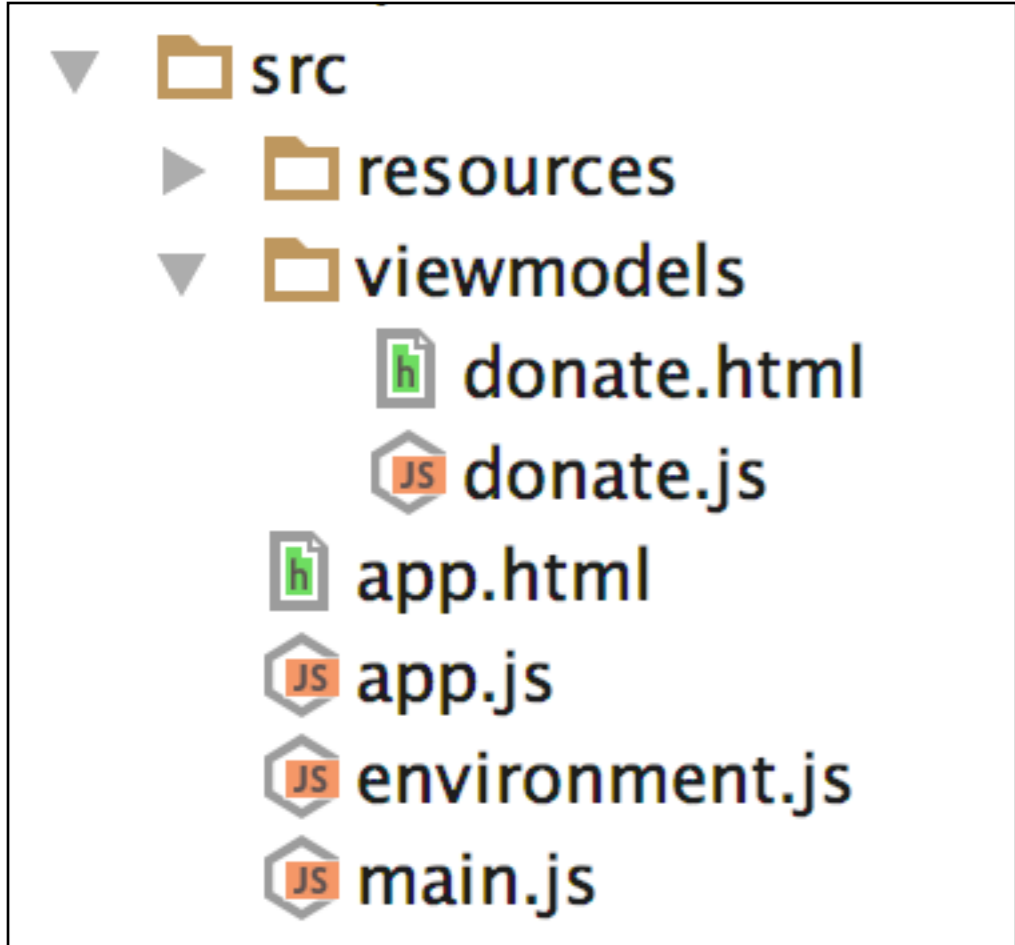

```
<template>  
  <compose view-model="./viewmodels/donate"></compose>  
</template>
```

```
export class App {  
  constructor() {  
    this.message = 'Hello World!';  
  }  
}
```

# main & environment

```
export default {  
  debug: true,  
  testing: true  
};
```

```
import environment from './environment';  
  
export function configure(aurelia) {  
  aurelia.use  
    .standardConfiguration()  
    .feature('resources');  
  
  if (environment.debug) {  
    aurelia.use.developmentLogging();  
  }  
  
  if (environment.testing) {  
    aurelia.use.plugin('aurelia-testing');  
  }  
  
  aurelia.start().then(() => aurelia.setRoot());  
}
```

- Program entry point
- Sets up config params and starts app
- Default behaviour of aurelia.setRoot() is to load 'app' view/view-model
